NOAA Technical Memorandum NMFS

The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information; and have not received complete formal review, editorial control, or detailed editing.

ABSTRACT

This report provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) cruises conducted off California and Baja California in 1984. It is the twenty-fourth report in a series that presents these data for all biological-oceanographic CalCOFI surveys from 1951 to the present. A total of 918 stations was occupied during 8 monthly multivessel cruises over the survey area, which extended from Pt. Reyes, California to Rosario Bay, Mexico, and seaward to several hundred miles. The data are listed in a series of 6 tables; the background, methodology, and information necessary for interpretation and quantitative analysis of the data are presented in an accompanying text. All pertinent station and tow data, including volumes of water strained and standard haul factors, are listed in the first table. Another key table lists, by station and month, standardized counts of each of the 135 larval fish categories identified from survey samples. This and previous and subsequent reports make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the computer data base.

INTRODUCTION

This report, the twenty-fourth of a series, provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) joint biological-oceanographic survey cruises conducted in 1984. This program was initiated in 1949, under the sponsorship of the Marine Research Committee of the State of California, to study the population fluctuations of the Pacific sardine (*Sardinops sagax*) and the environmental factors that may play a role in such fluctuations. CalCOFI, known as the California Cooperative Sardine Research Program from 1949 to 1953, was made up of representatives of the South Pacific Fisheries Investigations (SPFI) of the U.S. Fish and Wildlife Service [now the La Jolla Laboratory, National Marine Fisheries Service (NMFS)], the Scripps Institution of Oceanography (SIO), the California Department of Fish and Game (CDFG), the California Academy of Sciences (CAS) and the Hopkins Marine Station of Stanford University. The first three of these agencies supplied ships and personnel to conduct the sea surveys. NMFS processed the plankton samples and analyzed the ichthyoplankton from them. SIO processed and analyzed the hydrographic samples and measurements and also analyzed invertebrate groups from the plankton samples.

The boundaries, station placement, and sampling frequency for the CalCOFI survey area were based on the results of joint biological and oceanographic cruises conducted by NMFS and SIO during 1939-41. Those cruises were designed to collect sardine

eggs and larvae and associated hydrographic data over the entire areal and seasonal spawning range of the species. On these survey cruises, plankton tows were made to 70 m, a depth which encompassed the vertical distribution of sardine eggs and larvae. Wide-ranging joint biological and oceanographic survey cruises were resumed in 1949 with sardine as the focus; however, an increasing interest in other biological components resulted in the deepening of standard tows to 140 m in 1951. This marked the beginning of truly quantitative ichthyoplankton sampling on CalCOFI surveys.

Hydrographic data from 1984 CalCOFI surveys have been published by Scripps Institution of Oceanography (Univ. of Calif., SIO, 1984 a-d; 1985). All available original records for 1984 were subjected to an extensive verification and editing process to produce this CalCOFI ichthyoplankton data report. This, with previous (Ambrose et al., 1987a-c; 1988a-d; Sandknop et al., 1987a,b; 1988a-d; Stevens et al., 1987a-c; 1988a,b; Sumida et al., 1987a,b; 1988a-c) and subsequent reports, make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the computer data base. The data base is modified when errors are discovered and when composite taxa from the earlier years are reidentified. These reports are the fundamental reference documents against which subsequent changes in the data base can be compared.

SAMPLING AREA AND PATTERN

In 1984, the eight CalCOFI cruises occupied stations during portions of all months from January through July and during October. The total of 918 stations included in this data base was occupied on 8 cruises, with an average of 115 stations per cruise (range 70-158). The station pattern covered in 1984 began at line 60, Pt. Reyes, California, and extended south to line 110, Rosario Bay, Mexico. The entire pattern was covered on Cruises 8401, 8404, 8407, and 8410. Cruises 8402 and 8403 combined covered the whole area as did Cruises 8405 and 8406. The offshore extent of the coverage was to station 100 (ca. 200-300 miles offshore) on all cruises with two exceptions: on Cruise 8404 coverage of lines 60 through 73.3 extended only to station 70 (ca. 80-180 miles offshore) and on Cruise 8410 coverage of lines 63.3, 66.7, 70.0 and 76.7 ended with station 80 (ca. 120-220 miles offshore). (Figures 1-9, Table 1).

Beginning in 1981 we changed our designation of ordinal survey lines (those ending in "3" and "7") to an exact decimal notation. Thus, lines 63,67,73,77 etc. were changed to 63.3, 66.7, 73.3, 76.7 etc. to indicate accurately the spacing between cardinal lines (those ending with "0"). Scripps Institution of Oceanography continues to use the original designation for ordinal lines as

reflected in Figures 2-9 and in their data reports (Univ. of Calif., SIO, 1984a-d; 1985).¹

Two vessels were employed on 1984 survey cruises: the *David Starr Jordan* of NMFS, and the *New Horizon* of SIO. Both vessels participated in Cruises 8401, 8404, 8407 and 8410. Cruises 8402 and 8406 were conducted on the *New Horizon* and Cruises 8403 and 8405 on the *David Starr Jordan*. (Univ. of Calif., SIO, 1984 a-d; 1985).

SAMPLING GEAR AND METHODS

In 1978, the standard 1-m ring net with towing bridle was replaced by a bridle-free "bongo" net. The bongo frame (McGowan and Brown, 1966; Smith and Richardson, 1977) consists of a pair of circular frames connected to a central axle which is horizontal to the towing wire and attached to it by a clamp. The axle is free to rotate so that the mouth openings are vertical during the tow. The standard CalCOFI version of the bongo net has 71 cm diameter frames and net material constructed of nylon mesh. Each net consists of a cylindrical section ca. 146 cm long, a truncated conical section ca. 161 cm long, and a detachable cod end. The starboard net, from which the standard sample is taken, is constructed of 0.505 mm mesh. The sample from the port side is used for other purposes; the mesh size is either 0.505 mm or 0.333 mm depending on requirements. The cod end of each net is constructed of 0.333 mm mesh.

The standard tow in 1984 was an oblique haul to ca. 210 m depth (to 15 m from the bottom in shallow areas) designed to filter a constant amount of water per depth interval (ca. 2 m³/m of depth) over the vertical range of most ichthyoplankters. Hauls were made at a ship speed of 1.5-2.0 knots and were initiated by clamping the

¹CalCOFI lines (Figure 9) are arranged perpendicular to the coastline and extend from the Canadian border (line 10) to below Cape San Lucas, Baja California (line 157). Stations were established on the basis of a perpendicular to line 80 (off Pt. Conception) at a point designated as station 60. Stations were plotted seaward and shoreward from station 60 on each line. Cardinal CalCOFI lines (those ending in "0") are 120 miles apart and usually bracket two ordinal lines (ending in "3" or "7"), so that lines are 40 miles apart over most of the pattern. Cardinal stations are 40 miles apart and typically these are separated by a station number ending in "5" so that stations are 20 miles apart out to station 90 on most lines. Stations are placed at closer intervals near the coast and islands to accommodate these features (see Kramer et al., 1972, for further details).

net to the towing cable above the 34 kg terminal weight suspended below the surface. The net was lowered to ca. 210 m depth by paying out 300 m of wire over a 6 minute period (35 m of depth/min). After fishing at depth for 30 seconds, the net was retrieved at 20 m/min (14 m depth/min). The angle of stray of the towing cable was recorded every 30 seconds and maintained at 45° ($\pm 3^\circ$) by adjusting the ship speed and course. After reaching the surface, the nets were washed down and the samples preserved in 5% formalin buffered with sodium borate. Flowmeter readings were made at the beginning and end of each tow. Detailed descriptions of gear and methods are given by Kramer et al. (1972), and Smith and Richardson (1977).

LABORATORY PROCEDURES

Laboratory processing began with the determination of a displacement volume for each sample (methods described in Staff, SPFI, 1953; and Kramer et al., 1972). Sorting involved the removal of ichthyoplankton from the sample and identification and separation of: eggs and larvae of Pacific sardine and northern anchovy; larvae of Pacific hake; and eggs of Pacific saury. Some samples were fractioned into aliquots using a Folsom plankton splitter (McEwen et al., 1954) prior to the sorting. Criteria for fractioning were: 1) samples taken at a distance greater than 200 nautical miles from shore were not fractioned, 2) samples taken closer than 200 miles from shore and containing 25 ml or less of plankton were not fractioned, and 3) samples taken closer than 200 miles from shore and containing more than 25 ml of plankton were fractioned to 50% of their original volume (J.R. Thrailkill, pers. comm.). Aliquot percentages for fractioned samples from 1984 are listed in Table 1 under the "Percent Sorted" column; 41% of the samples collected in 1984 were fractioned.

A "standard haul factor" (SHF) was calculated for each tow to make them comparable and allow estimations of areal abundance. This factor adjusts the number of eggs or larvae in a haul to the number in 10 m^3 of water strained per meter of depth fished. If the vertical distribution of the species has been encompassed, then the adjusted value is equivalent to the number under 10 m^2 of sea surface. The SHF is calculated for each haul by the formula:

$$\text{SHF} = \frac{10}{V} D$$

where D = depth of haul = cosine of the average angle of stray of the towing cable multiplied by cable length (m)

V = total volume of water (m^3) strained during the haul

$$V = R \cdot a \cdot p$$

where R = total number of revolutions of the current meter during the haul

a = area (m^2) of the mouth of the net

p = length of column of water (m) needed to produce one revolution of the current meter.

Tow depth, volume of water strained, and standard haul factor are listed in Table 1 for each tow taken during 1984. Detailed descriptions of factors involved in calculating these values are presented in Ahlstrom (1948), Kramer et al. (1972), and Smith and Richardson (1977).

IDENTIFICATION

Identification of ichthyoplankton species beyond those separated during the sorting process was done by a separate group of specialists. Ontogenetic stages of fishes are inherently difficult to identify, and this is further complicated by the large number and diversity of species which contribute to the ichthyoplankton of the California Current region. Most identifications were accomplished by establishing ontogenetic series on the basis of morphology, meristics, and pigmentation, and then identifying these series by relating them to known metamorphic, juvenile, or adult stages with overlapping features (Powles and Markle, 1984). A total of 135 taxa was identified for 1984: 90 to species, 22 to genus, 18 to family, and 5 to order or suborder. In 1981 four species of Sciaenidae were identified for the first time: *Cheilotrema saturnum*, *Genyonemus lineatus*, *Roncador stearnsii*, and *Seriphus politus*. Another sciaenid, *Atractoscion nobilis*, was identified for the first time in CalCOFI samples in 1984, as was the anopterid, *Anopterus pharao*. In 1984 all larvae of *Citharichthys* were identified to species, whereas in 1951-1953 and 1961-1981 only large specimens of *C. stigmatus* were identified to species (Sumida et al., 1987a; Ambrose et al., 1988d).

Other identification caveats are as follows:

Engraulis mordax - some nearshore samples of small *E. mordax* may contain other anchovy genera which could not be differentiated.

Bathylagus spp. - includes small and/or disintegrated specimens of *Bathylagus* or *Leuroglossus stilbius*.

Lampanyctus regalis - underrepresented because of inability to differentiate small larvae (<5 mm) from those of other *Lampanyctus* species; counts may include other species of this large and complex genus.

Lampanyctus ritteri - comment for *L. regalis* applies to this species.

Blennioidei - this category includes members of northern stichaeioid families and true blennioids (other than *Hypsoblennius* spp.) in the southern part of the pattern.

COMPUTER ENTRY AND EDITING

Each taxon listed on the original identification sheets was given a 3-digit code based on the list of codes in Haight et al. (1979). Taxon codes and counts from these sheets were entered by cruise and station, along with pertinent station and tow data, into the VAX 11/780 computer at the University of California, San Diego, Computing Center. After entries were completed for the entire year, print-out listings of taxa and counts at each station were compared with the original data sheets to eliminate keypunch errors. Next, data in the file were cross-checked with data in an existing file that contained: station and tow data; numbers of eggs of sardine, anchovy, and saury; numbers of larvae of sardine, anchovy, hake, jack mackerel, and Pacific mackerel; total number of fish eggs; and total number of fish larvae.

Discrepancies in ichthyoplankton data in these two files were corrected by inspecting original records from the sorting laboratory, the original ichthyoplankton identification sheets, and the samples themselves. Station and tow data discrepancies between the two files were corrected by reviewing ships' logs and deck tow sheets, original records from the sorting laboratory, cruise announcements, publications, header information on the ichthyoplankton identification sheets, and station plots generated for each cruise. All station and tow data were checked by comparing these sources.

A listing of each taxon by station (Table 4) was the primary document for subsequent checks. Misidentifications found in geographic outlier checks and other misidentifications and data problems discovered in the course of examining archived samples resulted in several iterations of Table 4. Finally, totals in Table 4 were checked against annual summaries of incidence and abundance (Tables 2 and 3). Ecological analyses of the data were conducted concurrently with editing procedures and provided cross-checks that allowed correction of errors.

SPECIES SUMMARY

Larvae of northern anchovy (*Engraulis mordax*) represented 41.4% of all fish larvae taken on CalCOFI cruises during 1984 and were 2.5 times more abundant than the lightfish species, *Vinciguerria lucetia*, the next ranking taxon with 16.5% of the

total larvae; northern anchovy ranked second in frequency of occurrence while *V. lucetia* ranked third (Tables 2, 3). The myctophid *Protomyctophum crockeri* ranked first in frequency of occurrence but only ninth in abundance with 1.4% of the total larvae. Pacific hake, *Merluccius productus*, ranked third in abundance with 9.6% of total larvae, and 17th in incidence. *Sebastes* spp. ranked fourth in both abundance (5.0% of total larvae) and incidence. Fifth, sixth and seventh in numbers of larvae were a myctophid, *Stenobrachius leucopsarus* (4.3%), the deep-sea smelt *Leuroglossus stilbius* (4.0%), and another myctophid *Triphoturus mexicanus* (2.6%). These ranked 6th, 9th and 5th respectively in numbers of occurrences. The last three of the ten most abundant taxa were a deep-sea smelt *Bathylagus ochotensis* (1.9%), the myctophid *Protomyctophum crockeri* noted above (1.4%) and the bristlemouth *Cyclothona* spp. (1.1%). These ranked 7th, 1st and 8th in occurrence. The 10 most abundant taxa included 88% of all the larvae collected during CalCOFI cruises in 1984. The remaining 12% was distributed among 125 other taxa plus the disintegrated and unidentified categories. Of the top 10, 7 are midwater taxa, 2 are coastal demersal taxa, and 1 is a coastal pelagic species.

EXPLANATION OF TABLES

Table 1 - This table lists by cruise the pertinent station and tow data for 1984: the volume of water filtered and standard haul factor for each tow, the percent of sample sorted, and the total numbers of fish eggs and larvae. CalCOFI cruises are designated by four digits; the first two indicate the year and the second two the month. Within each cruise the data are listed in order of increasing line and station number (southerly and seaward directions); the order of station occupancy is shown on the station charts (Figures 2-8). Stations are designated by two groups of digits; the first set indicates the line and decimal fraction, and the second set indicates the station on the line. Time is listed as Pacific Standard Time at the start of each tow in 24-hour designation. Methods for determining tow depth, volume of water strained, standard haul factor, and percent sorted were described in the methods section. The values for total fish eggs and larvae represent raw counts (unadjusted for percent sorted or standard haul factor). Ship codes are as follows: JD, David Starr Jordan; NH, New Horizon.

Table 2 - This table lists pooled occurrences of all larval fish taxa taken during 1984 in ranked order.

Table 3 - This table lists pooled counts of all larval fish taxa taken during 1984 in ranked order. Numbers are adjusted for percent sorted and standard haul factors.

Table 4 - This table gives numbers of fish larvae for each taxon, listed by station and calendar month in which the tow was taken. Counts are adjusted for percent of sample sorted and standard haul factor. Average values are given for stations occupied more than once during a month. See Table 1 for station and tow data and Table 6 for listing of stations with multiple occupancies during a month. Multiple occupancies occurred when a station was occupied more than once during a calendar month. The orders are listed in "phylogenetic" sequence modified from Nelson (1984). Subtaxa within each order are listed alphabetically. Page numbers for each taxon are given in the index at the end of the report.

Table 5 - This table is a summary of pooled occurrences of all larval fish taxa taken on CalCOFI surveys from 1972 to 1984. Taxa are listed in the same order as in Table 4.

Table 6 - List of stations with multiple occupancies in one month during 1984.

ACKNOWLEDGMENTS

David Ambrose, Elaine Sandknop and one of us (EGS) originally identified larvae from CalCOFI cruises in 1984. Amy E. Hays coded each larval fish taxon or type and entered it into the computer. Dorothy Roll designed the CalCOFI data acquisition system. Roy Allen helped with graphics and production of the report. Lorraine Prescott prepared the manuscript for printing. Paul Smith offered helpful suggestions throughout the project. Izadore Barrett, Director of the Southwest Fisheries Center, provided the support critical to the completion of the project. James Thrailkill planned CalCOFI surveys and supervised cruises, data handling, and plankton sorting from 1949 to 1986 and is largely responsible for the high quality of these operations. Without the vision and direction of Elbert Ahlstrom and Elton Sette and the dedicated efforts of the many people who collected, processed, and analyzed the samples, this data base would not exist.

TABLE 4. Numbers of fish larvae taken on stations occupied during CALCOFI cruises in 1984. Counts are adjusted for percent of sample sorted and standard haul factor (see text). Average number is given for stations occupied twice during a single month. Unoccupied stations are indicated by a dash.

TABLE 5. Summary of pooled occurrences of all larval fish taxa taken on CalCOFI surveys from 1972 to 1984. Data for 1974, 1977, and 1980 represent single cruises that are part of surveys in 1975, 1978, and 1981, respectively. Taxa are listed in the same order as Table 4.

NAME	1972	1974	1975	1977	1978	1980	1981	1984

TABLE 6. List of stations which were occupied twice in one month during 1984.

Station	Month
73.3 50.0	10

INDEX

This index lists taxa included in Table 4 with their page numbers.

	Page
Anguilliformes	63
Clupeiformes	
Clupeidae	
<i>Etrumeus acuminatus</i>	63
<i>Sardinops sagax</i>	63
Engraulidae	
<i>Engraulis mordax</i>	63
Salmoniformes	
Argentinidae	
<i>Argentina sialis</i>	66
<i>Microstoma microstoma</i>	66
<i>Nansenia candida</i>	67
Bathylagidae	
<i>Bathylagus spp.</i>	68
<i>Bathylagus milleri</i>	68
<i>Bathylagus ochotensis</i>	69
<i>Bathylagus pacificus</i>	71
<i>Bathylagus wesethi</i>	72
<i>Leuroglossus stilbius</i>	73
Stomiiformes	75
Gonostomatidae	
<i>Cyclothona spp.</i>	76
<i>Danaphos oculatus</i>	78
<i>Ichthyococcus spp.</i>	78
<i>Valencienellus stellatus</i>	78
<i>Vinciguerria lucetia</i>	78
<i>Vinciguerria poweriae</i>	81
Sternopychidae	
Stomiatoidea	
Chauliodontidae	
<i>Chauliodus macouni</i>	83
Idiacanthidae	
<i>Idiacanthus antrostomus</i>	84
Malacosteidae	
<i>Aristostomias scintillans</i>	85
Melanostomiidae	
<i>Bathophilus spp.</i>	85
<i>Tactostoma macropus</i>	85
Stomiidae	
<i>Stomias atriventer</i>	85
Myctophiformes	
Alepisauroidei	
Anopteridae	
<i>Anopterus pharao</i>	86

	Page
Paralepididae	86
<i>Lestidiops ringens</i>	86
<i>Notolepis risso</i>	87
Chlorophthalmoidei	
Notosudidae	
<i>Scopelosaurus</i> spp.	88
Scopelarchidae	
<i>Benthalbella dentata</i>	88
<i>Rosenblattichthys volucris</i>	88
<i>Scopelarchus</i> spp.	89
Myctophoidei	
Myctophidae	89
Lampanyctinae	
<i>Bolinichthys</i> spp.	91
<i>Ceratoscopelus townsendi</i>	91
<i>Diaphus</i> spp.	92
<i>Lampadena urophaos</i>	93
<i>Lampanyctus</i> spp.	94
<i>Lampanyctus regalis</i>	96
<i>Lampanyctus ritteri</i>	96
<i>Notolychnus valdiviae</i>	98
<i>Notoscopelus resplendens</i>	98
<i>Stenobrachius leucopsarus</i>	99
<i>Triphoturus mexicanus</i>	101
Myctophinae	
<i>Diogenichthys</i> spp.	104
<i>Diogenichthys atlanticus</i>	105
<i>Diogenichthys laternatus</i>	106
<i>Electrona rissoii</i>	107
<i>Gonichthys tenuiculus</i>	108
<i>Hygophum</i> spp.	108
<i>Hygophum atratum</i>	108
<i>Hygophum reinhardtii</i>	109
<i>Loweina rara</i>	109
<i>Myctophum nitidulum</i>	109
<i>Protomyctophum crockeri</i>	110
<i>Symbolophorus californiensis</i>	113
<i>Tarletonbeania crenularis</i>	115
Synodontoidei	
Synodontidae	
<i>Synodus</i> spp.	115
Gadiformes	
Merlucciidae	
<i>Merluccius productus</i>	115
Macrouridae	117
Ophidiiformes	117
Bythitidae	
<i>Brosmophycis marginata</i>	117

	Page
Ophidiidae	
<i>Chilara taylori</i>	118
<i>Ophidion scrippsae</i>	118
Lophiiformes	
Ceratioidei	118
Gobiesociformes	
Gobiesocidae	118
Beloniformes	
Exocoetidae	118
Scomberesocidae	
<i>Cololabis saira</i>	119
Atheriniformes	
Atherinidae	119
Lampriformes	
Trachipteridae	119
Beryciformes	
Melamphaidae	
<i>Melamphaes</i> spp.	120
<i>Poromitra</i> spp.	121
<i>Scopeloberyx robustus</i>	121
<i>Scopelogadus bispinosus</i>	122
Syngnathiformes	
Macroramphosidae	
<i>Macroramphosus gracilis</i>	122
Syngnathidae	
<i>Syngnathus</i> spp.	122
Scorpaeniformes	
Cottoidei	
Agonidae	122
Cottidae	122
<i>Scorpaenichthys marmoratus</i>	123
Hexagrammidae	
<i>Oxylebius pictus</i>	123
<i>Zaniolepis</i> spp.	123
Scorpaenoidei	
Scorpaenidae	
<i>Scorpaena</i> spp.	123
<i>Sebastes</i> spp.	124
<i>Sebastes aurora</i>	126
<i>Sebastes jordani</i>	126
<i>Sebastes levis</i>	127
<i>Sebastes macdonaldi</i>	127
<i>Sebastes paucispinis</i>	127
<i>Sebastolobus</i> spp.	128
Perciformes	
Blennioidei	128
Blenniidae	
<i>Hypsoblennius</i> spp.	128

	Page
Clinidae	128
Gobioidei	
Gobiidae	129
Icosteoidei	
Icosteidae	
<i>Icosteus aenigmaticus</i>	129
Labroidei	
Labridae	
<i>Halichoeres</i> spp.	129
<i>Oxyjulis californica</i>	129
<i>Semicossyphus pulcher</i>	130
Pomacentridae	
<i>Chromis punctipinnis</i>	130
Percoidei	
Carangidae	
<i>Trachurus symmetricus</i>	130
Gerreidae	132
Haemulidae	132
Sciaenidae	
<i>Atractoscion nobilis</i>	132
<i>Genyonemus lineatus</i>	132
<i>Seriphus politus</i>	132
Serranidae	133
Scombroidei	
Gempylidae	133
Scombridae	
<i>Scomber japonicus</i>	133
Trichiuridae	
<i>Lepidopus xantusi</i>	133
Sphyraenoidei	
Sphyraenidae	
<i>Sphyraena argentea</i>	133
Stromateoidei	
Centrolophidae	
<i>Icichthys lockingtoni</i>	134
Stromateidae	
<i>Peprilus simillimus</i>	134
Tetragonuridae	
<i>Tetragonurus cuvieri</i>	134
Trachinoidei	
Chiasmodontidae	135
Pleuronectiformes	
Pleuronectoidei	
Paralichthyidae	
<i>Citharichthys</i> spp.	135
<i>Citharichthys sordidus</i>	136
<i>Citharichthys stigmaeus</i>	136
<i>Citharichthys xanthostigma</i>	137

	Page
<i>Hippoglossina stomata</i>	137
<i>Paralichthys californicus</i>	138
<i>Xystreurus liolepis</i>	138
Pleuronectidae	
<i>Glyptocephalus zachirus</i>	138
<i>Hypsopsetta guttulata</i>	138
<i>Lepidopsetta bilineata</i>	138
<i>Lyopsetta exilis</i>	139
<i>Microstomus pacificus</i>	139
<i>Parophrys vetulus</i>	139
<i>Pleuronichthys coenosus</i>	139
<i>Pleuronichthys decurrens</i>	140
<i>Pleuronichthys ritteri</i>	140
<i>Pleuronichthys verticalis</i>	140
<i>Psettichthys melanostictus</i>	140
Disintegrated fish larva	140
Unidentified fish larva	143

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Microfiche copies cost \$4.50. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Center are listed below:

- NOAA-TM-NMFS-SWFC- 131 Report of ecosystem studies conducted during the 1988 eastern tropical Pacific dolphin survey on the research vessel *David Starr Jordan*.
L.J. LIERHEIMER, P.C. FIEDLER, S.B. REILLY, R.L. PITMAN, L.T. BALLANCE, G.G. THOMAS and D.W. BEHRINGER
(June 1989)
- 132 Report of ecosystem studies conducted during the 1988 eastern tropical Pacific dolphin survey on the research vessel *McArthur*.
L.J. LIERHEIMER, P.C. FIEDLER, S.B. REILLY, R.L. PITMAN, L.T. BALLANCE and D.W. BEHRINGER
(June 1989)
- 133 The 1987-88 demersal fish surveys off Central California (34°30'N to 36°30'N)
J.L. BUTLER, C.A. KIMBRELL, W.C. FLERX and R.D. METHOT
(July 1989)
- 134 The First 25 Years.
ILLIAN L. VLYMEN
(September 1989)
- 135 Censuses and interatoll movements of the Hawaiian monk seal on Laysan Island, 1985.
B.L. BECKER, R.J. MORROW, and J.K. LEIALOHA
(September 1989)
- 136 Summary of the 1987 U.S. tuna/porpoise observer data.
A.R. JACKSON
(October 1989)
- 137 Biomass-based models and harvesting policies for Washington-Oregon-California rockfish stocks with correlated recruitment patterns
J.E. HIGHTOWER
(April 1990)
- 138 Effects of including in mortality estimates, dolphins categorized as either injured or of undetermined status.
C.W. OLIVER and E.F. EDWARDS
(May 1990)
- 139 Report of ecosystem studies conducted during the 1989 eastern tropical Pacific dolphin survey on the research vessel *David Starr Jordan*.
L.J. LIERHEIMER, P.C. FIEDLER, S.B. REILLY, R.L. PITMAN, L.T. BALLANCE, S.C. BEAVERS, G.G. THOMAS and D.W. BEHRINGER
(May 1990)
- 140 Report of ecosystem studies conducted during the 1989 eastern tropical Pacific dolphin survey on the research vessel *McArthur*.
L.J. LIERHEIMER, P.C. FIEDLER, S.B. REILLY, R.L. PITMAN, L.T. BALLANCE, S.C. BEAVERS and D.W. BEHRINGER
(May 1990)
